VX Plinth system Revision

The VX plinth system has been revised and optimized based on feedback from many customers.

Technical execution:

- Corner piece with support angle in width pre-assembled together with base cover
- Plinth trims equipped with a hole for screw connection at the side to optionally provide the depth with an angle (also necessary for tooling purposes, since front & rear and side trims are identical)

Advantages of the new solution

More stability - plinth trims can be lifted with forklift & pallet truck, but still excluded by Rittal (situation same as TS plinth)

Front panel screw connection from the front - easy access during assembly and disassembly of the front and rear panels

Pre-assembled - time savings for customers

Changeover to new solution

- The revised solution **replaces the current plinth system version**
- **Article numbers are not retained** for reasons of traceability (conversion aid on page three).
- Planned availability from March 2020 - **Due to production capacities hard changeover within 2 weeks**
- Plinths are compatible with each other, can be added to each other and old side-mounted plinths can be remounted on new front & rear plinth elements
